End of Waste

The circle of recycling

Recycling of residual flows is an integral part of our world today. With recycling, we save raw materials and energy and can contribute to a better world. Our company has been a well-known player in the field of plastic recycling for years.

Recycling literally means 'to reuse'. The plastics from waste are reused to make something new out of them. This circle saves both raw materials and energy. This circle is seamlessly applied and implemented within our company:

Old, hard plastics are brought to us, after which we initiate the recycling process. The plastic is being sorted, shredded, washed, grinded and dried at our site.

Our focal points

Processing

We recycle numerous hard plastics into grinding material. This is our contribution to a cleaner and safer world!

Sorting

Our sorting process is unique and unrivalled, both in the Netherlands and internationally. We have special machines that allow us to sort our regrind in a unique way.

Quality and innovation

Optimisation of our company has our constant attention. By continuously developing, investing and fine-tuning the process, we guarantee our quality. All our end products are tested in our own laboratory after processing to ensure they meet your specific needs and requirements.

Circular

Thanks to our modern production lines, we are able to offer a high-quality end product which is highly suitable for new plastic products.

PP Big Bag Scrap

Big Bags Recycling

You can turn to BVDER for the recycling of Big Bags. These can be purchased by us separately and in bales, after which we recycle them at our own site.
